

VVR VENTURI VOLUME CONTROL VALVE

Accurate Venturi Air Volume Measurement
Venturi according to DIN 1952/ISO 5167
External Air Tight to DIN 24194 Part 4
Shut off Air Tight to DIN 1946 Part 4
Heavy duty Blade Seal
12 mm Ø solid drive shaft for fast speed
Rotation 0..360° with a round damper blade
Shaft bearings for low rotation torque
Body lip seals for easy site installation
Actuator and DPC controller can be factory fitted
All CMR sensors can be factory fitted to Venturi
24 month warranty
35 Years field application experience

VVR Venturi Valve with DPC Controller

Valve Body Construction

The CMR Venturi Valve is manufactured to the highest engineering precision with CNC machines. The valve is made of a flat galvanised senzimir sheet metal with all cut outs for the damper blade, axle and the tube fittings. The flat plate is then formed into a precision round body and the edges are butt laser welded with a CNC Laser, which provides a perfect seal without the need for anti corrosion paint.

The damper blade consists of two metal plates which sandwich a silicone disc seal. A 12mmØ axle is fitted with heavy duty clamps onto the blades and is then embedded into air tight bearings on both sides of the valve to provide smooth action with very low torque. The blade and axle are designed for very fast motor rotation i.e. 1 second from open to closed position. With such high speeds, the axle will withstand the enormous torque which develops on the shaft when turning from open to close in small steps to provide high accuracy control without a fluctuating Hysteresis.

Venturi Construction

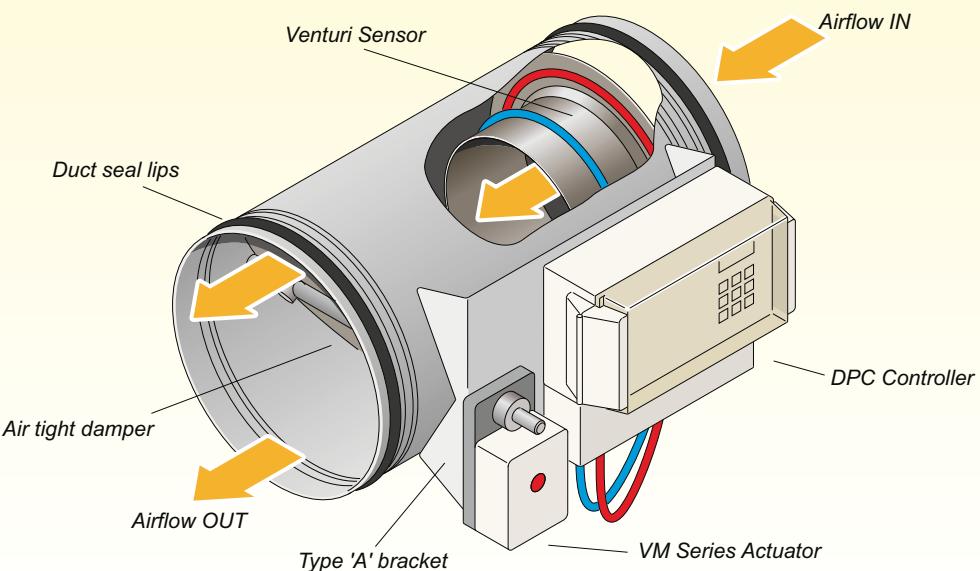

The Venturi is designed for each Size and formed to the same precision with CNC machines. It consists of four total averaging pressure measurement holes on the inlet of the venturi. The venturi is welded into the inside of the valve which has a reduced open area. The air is forced through the nozzle at higher speed and four static averaging pressure holes pick up the increased static pressure.

Venturi Measurement

The velocity pressure is converted by the Volume Sensor into a scaled and linear air volume providing either l/s, m³/s or m³/h. The venturi in combination with the CMR sensor is factory calibrated and provides an accurate and repeatable measurement.

Due to the very unique shape of the venturi, the pressure is regained and a low total overall pressure drop is achieved.

VVR-A Venturi Valve with DPC Controller and fast Actuator 0-90° and Modbus rtu communication

VVR VENTURI VALVE SPECIFICATIONS

Volume Control Damper

It is essential to determine the air volume during the design stage. Normally there is a minimum and a maximum volume which has to be controlled.

The duct area should be calculated so that the velocity is approximately 2.5m/s at the minimum volume and preferably 5m/s at the operating point if possible. If the velocity is more than 5m/s at the maximum volume then the noise level criteria needs to be considered. The maximum velocity should not exceed 9m/s as the duct resistance shall increase and the overall energy consumption shall go up. Use selection Table on page 4.

The VVR Venturi Valves is equipped with an 'A' bracket making it a VVR-A. It has double damper blades with an embedded silicone seal. Other materials are available on request. The venturi reduces the diameter for a very short length and it is formed for pressure regain. The reduced internal area of the valve shall increase the velocity pressure momentarily but will have a regain of pressure after passing through the venturi, which means that the overall pressure drop can be kept at a minimum.

The heavy duty drive shaft which is bolted firmly to the valve blade is designed to withstand the very high momentary torque developed by the fast actuator. The shaft is guided by sealed bearing bushes on either side of the valve body.

Installation

The VVR Venturi Valve works in any position provided it is used in non condensing conditions. It is best if the actuator installed on top and side rather than hanging down. This way, the weight is reduced on the side seals and provides a long term efficient operation. It is also easier for the maintenance engineers to replace an actuator. When the damper is installed, care must be taken to leave sufficient space for the engineers to inspect and replace the motor. A minimum of 600mm would be ideal.

Hysteresis

The VVR Venturi Valves have a very low hysteresis due to the sturdy single blade construction and therefore the damper can be moved very accurately to a control position.

Maintenance

The VVR Venturi Valve is maintenance free.

Materials

VVR Valve Body	- Galvanised Sheet Metal
Blade/Seal	- Galvanised Sheet Metal/Silicone
Drive Shaft	- Zinc Plated Steel
Drive Shaft Seal	- 'O'Ringsl
Bearing Bushes	- Brass
Outer Duct Seals	- Pressed in Rubber
Actuator Brackets 'A'	- Galvanised Sheet Metal
Tubing	- PVC

Valve sizes see table on right.

Valve diameters are sized to fit into standard round spiral duct. The Part No. starting with VVR-A has a DPC/Actuator bracket. Alternative Brackets on request.

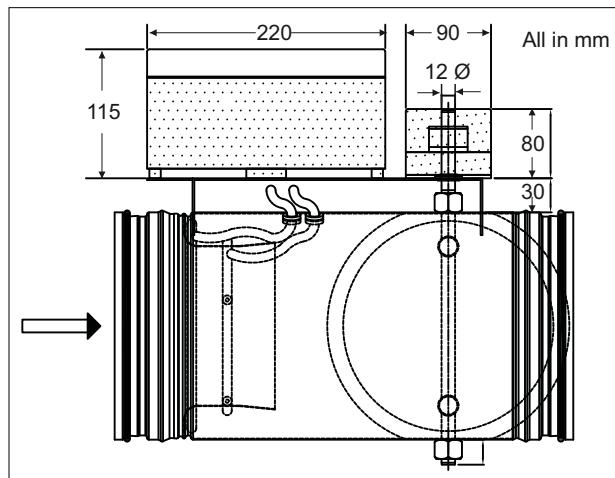

Custom Valves can be made on request.

Specifications

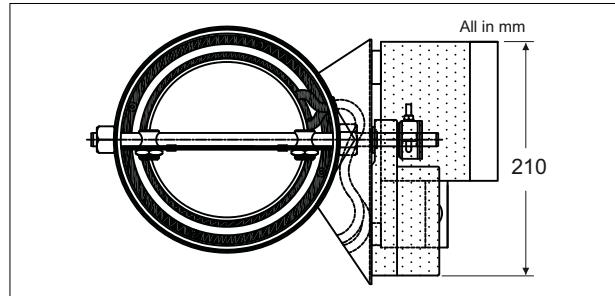

Recommended minimum air velocity is	2.5 m/s
Recommended operating air velocity is	5 m/s
Maximum recommended air velocity is	9 m/s

Humidity 10% to 90% non condensing.

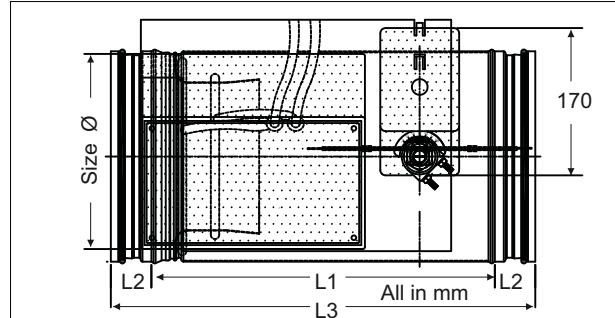

Operating Temperature (dry condition) -20 to 80°C

VVR-A Venturi Valve with DPC Controller and fast Actuator

The stock code is for the VVR-A valve only without actuator and DPC Controller.

VVR VENTURI VELOCITY PRESSURES

VVR Venturi tube connections

The velocity pressure is measured by the Venturi built into the VVR Valve and the total impact pressure is measured on the positive (+red) and the static pressure is measured on the negative (- blue) tube connections. The CMR Volume Sensor shall be connected to the corresponding nipples using CMR PVC red and blue tube. When the CMR Sensors are ordered with the VVR Venturi then it is pre-adjusted at the factory - i.e. duct diameter, density and VVR Venturi Magnification Factor (mf) and the range is in m³/s, m³/h, l/s or ACR (air change rate). It is ready for connection to the control or monitoring system.

To get the range of the CMR Sensor use the keyboard and display the range . This is the sensor range in m³/s or m³/h at 10V / 20mA. Enter this range into your control system. No further calculations are necessary. If you want to use the table above, use the range of the transmitter in Pa and divide it by the (mf) of the VVR. Look up the velocity above. i.e. 100Pa / 4.539 (315 Valve) = 22.03 Pa.

Look up above ~ 22.03 Pa and read on side and top ~ 6.05 m/s then multiply with duct area 0.07794(315 Valve) m² to get m³/s then multiply by 3600 to get m³/h.

If the CMR Volume Sensor such as P-Sensor, V-Sensor, DPM-Sensor or DPC-Controller was ordered separately and it was not factory adjusted then it is quite simple to adjust the parameters on site. All Sensor have a keyboard and display. The duct diameter and the magnification factor of the VVR Venturi Valve must be entered which is stated on each valve size on page 2.

If the volume indicated on the CMR Sensor display is deviating from the actual measurements, then the magnification factor can be adjusted to suit the installation abnormalities via the Sensor's keyboard. To find the best possible accuracy for your application, adjust the fan to a constant volume – start with 50% of the minimum and maximum operating volume and take a pitot travers reading with an independent instrument. Once the average volume has been established and it is not the same as displayed on the CMR Sensor, then adjust the Magnification Factor (mf) until the same display is achieved. Check at 25%, 75% and 100% volume set point. The CMR Sensors have also parameters to linearize each point of the measurement for more critical applications.

Useful VVR Venturi scaling formula:

$$\text{velocity m/s} = \sqrt{\frac{2 \times (\Delta P \text{ in Pa} / (\text{mf} \text{ factor}))}{1.2 \text{ Density}}}$$

Example:

$$2 \times (100\text{Pa across VVR-A-315} / 4.539 \text{ mf}) = 44.06 / 1.2 = 36.71$$

$$\sqrt{36.71} = 6.058 \text{ m/s}$$

$$6.058 \text{ m/s} \times (\text{duct area } 0.07794) = 0.472 \text{m}^3/\text{s} * 3600 = 1699 \text{ m}^3/\text{h}$$
